About

CreateForge AI is an AI creation platform for planning, generating, and keeping image and video work in one place. It lets you draft a prompt in the browser, move into a model page to pick the right engine, review a credit quote before submission, and track the job through completion. The service is organized around creative workflow rather than one-off generation, with a model catalog, private library, and account-based credits.

What is CreateForge AI

CreateForge AI is a browser-based AI creation workspace for generating images and

while the model pages handle the actual generation step after sign-in. According to the site, the platform centers on three ideas: choosing the right model for the task, seeing a parameter-aware credit quote before you submit, and keeping the finished media in a durable library.

It is built for creative production rather than casual experimentation. The site says you can work with nine image models and eight video models, and that supported workflows include text-to-image, image editing, text-to-video, image-to-video, and model-specific reference inputs. The product also distinguishes between the draft stage and the account stage, so the public composer is not the same place where generation happens.

Key features

- **Model catalog with multiple engine families**: The site lists image models from OpenAI, Black Forest Labs, ByteDance, and Google, plus video models from Google, xAI, MiniMax, and ByteDance.
- **Protected quote before submission**: CreateForge shows a parameter-aware credit quote so you can see the cost context before generating.
- **Quick Create draft flow**: You can write a prompt on the public page and continue on a model page instead of submitting immediately.
- **Job tracking**: The platform keeps generation state visible from submission through completion, including retries and failures.
- **Saved output library**: Completed images and videos stay in a private library instead of disappearing behind temporary links.
- **Model-specific controls**: The site mentions supported controls such as canvas, resolution, quality, aspect ratio, and private references, depending on the model.
- **Image and video coverage**: The workspace supports both still-image generation and video creation, so it can handle a wider range of creative tasks.

How to use it

1. **Draft your idea on the home page.** The quick create box lets you describe the image you want and keep that draft in the current browser session.
2. **Open the model page.** Quick Create leads you into a selected model, and the site

Choose the right setup. Pick the model, then review the supported options such as aspect ratio, resolution, quality, or reference inputs if they are available for that model.

Check the credit quote. Before you submit, CreateForge shows a quote tied to the current parameters so you know the expected credit use.

Generate after signing in. The FAQ states that you need to sign in to upload files, generate results, use credits, and save work to the Library.

Track and keep the output. Watch the job state through completion and save the successful result for later reuse.

Who it is for

CreateForge AI is aimed at people who need a more organized AI image generation platform or AI video generator than a simple one-button tool.

Designers and art directors who want to compare models and keep outputs organized.

Content teams that need a record of prompts, credits, and final media.

Prompt-heavy creators who want to describe lighting, composition, materials, typography, and finish before generating.

Users evaluating model choice who want to select between GPT Image 2, FLUX 2 Pro, Seedream, Nano Banana, Veo 3.1, Grok Imagine Video 1.5, MiniMax H3, and Seedance variants.

Anyone managing repeated iterations who needs saved results and visible job history rather than temporary links.

What to know before you use it

CreateForge AI has a few clear boundaries that matter before you start. The public Quick Create composer does **not** generate the final asset by itself; it only prepares a draft and opens the model page. The site also says the draft prompt stays in the browser session and does not go into the URL, cookie, page metadata, or a public API request.

A few other caveats are important:

Model support varies. Controls, resolutions, aspect ratios, and reference options depend on the specific model page, so not every option exists everywhere.

The homepage preview is not an account result. The visual shown on the public page is described as a direction sample, not a saved output from your account.

Credit behavior is model- and parameter-dependent. The platform shows a quote before submission, but the exact cost depends on the chosen model and settings.

Use official sources for final decisions. If you need authoritative details on pricing, available models, or account behavior, check the live CreateForge pricing page, model pages, or FAQ because availability can change.

CreateForge AI is best used when you want a structured AI creation platform with clear model choice, credit visibility, and persistent results, especially if you need to keep every generated image or video in one place.

FAQ

Does CreateForge AI generate content from the public Quick Create page?

Is CreateForge AI free to use?

What kinds of models does CreateForge AI offer?

What can I do on the public page?

What can I make with CreateForge AI?

Is CreateForge AI web-only?

Does CreateForge AI support both images and video?

Does Quick Create produce a finished image on the homepage?

Can I save my finished outputs in CreateForge AI?

Where are finished outputs stored?
